

# CARE +THY

The main concept of CARETHY+ is to create an adaptable tool to locate and design a healthcare center, which will incorporate the scale, layout, functional and structural requirements along with constructability. CARETHY+ offers a solution for both small and large scale of facilities, while focussing on the large scale - and designing of a major healthcare facility. The process is gamified, since we imagine the project to allow a high degree of user participation in order to empower the displaced refugees and make the healthcare center highly customized to their needs.

The construction of the project is based on the principles of Gothic Architecture. The main principles taken forward are the architectural proportions and structural stability, and these are applied to adobe construction techniques.

The CARETHY+ game follows a simple rule set which works on the principle of evaluation and improvement each time the player plays the game. The presented configurations is improved based on optimizing circulation and adjacencies of functions.
